Exchange API: Errors

Every error has a JSON body with code and message.

429 rate_limited: you went over a rate limit. The response has a Retry-After header with the seconds to wait. Wait that long before you retry; repeated 429s within one minute block the key for 60 seconds.

400 bad_request: a parameter is missing or has the wrong type. The message names it.

401 invalid_signature: the signature or the timestamp is wrong. Check your clock and the string you signed.

404 unknown_symbol: the symbol is not listed. GET /symbols lists every market.

503 unavailable: the exchange is in maintenance. Retry with exponential backoff, starting at one second.
