Exchange API: Getting started

Base URL: https://api.exchange.example/v1. All requests and responses are JSON.

Sign every private request with your API key and secret: an HMAC-SHA256 of the timestamp, the method, the path and the body, sent in the X-Signature header.

Timestamps are Unix milliseconds in UTC. A request more than 5 seconds old is refused.

Symbols use the BASE-QUOTE form, for example BTC-USD or ETH-USD.

Try your code against the sandbox first: https://sandbox.exchange.example/v1 holds test balances and the same endpoints.

Candles: GET /candles?symbol=BTC-USD&interval=1h returns open, high, low, close and volume for each interval, oldest first.

Order book: GET /orderbook?symbol=BTC-USD&depth=50 returns the best 50 bids and asks.
