Exchange API: Rate limits

Limits are counted per API key over a rolling one-second window.

Order endpoints (POST /orders, DELETE /orders/{id}): 10 requests per second.

Market data endpoints (GET /ticker, GET /candles, GET /orderbook): 20 requests per second.

GET /candles returns at most 1,000 candles per request; page back with the end parameter for older data.

Every response carries the X-RateLimit-Remaining and X-RateLimit-Reset headers, so a client can slow down before it is refused.

Intervals: 1m, 5m, 15m, 1h, 4h and 1d. A request for more than 1,000 candles is cut to the newest 1,000; it is not an error.

WebSocket: up to 5 subscribe messages per second on each connection, and up to 10 connections per API key.
